October 1, 2026

I am a Computer Engineering student hailing from Brazil with some proficiency in C++ and Python, and I can bring my early academic foundation and hands-on experience to a dynamic environment to make an impact.

I did work for the Computer Vision Laboratory of my university, which allowed me to showcase my research skills and adaptability. In this role, I took ownership of researching and training a reliable fire and smoke detection model for a drone and explore and study other machine learning models and computer vision frameworks. My github showcases some small project archives related to computer vision, machine learning, and software, early university homework.

I had some early experience with desktop and web programming before entering university, as well as some computer graphics self-learning. I can adapt fast and try to deliver something especially in this era of AI. I am confident that my hands-on research experience, coupled with my programming skills in C++ and Python, would allow me to make meaningful contributions to your projects while continuing to grow as an engineer.

Sincerely,

Wesley Batista
